NCRC Meeting 13 January 2025

The meeting was called to order by Vice President Jim Sendrak at 19:10. This late start was caused by difficulty with the AV set up. Video projection and the Zoom session were not operational.

The minutes from the short business session held during the December Christmas party were not read nor approved.

New members Rene Martel, Greg Lavoy, and Joe DeMarco were voted into membership.

About this time John Vecoli was able to restore video projection with a backup projector.

Treasurer John Jackman reported that our account balances had decreased slightly due to expected on-going expenses.

Repeater lead Dave Neal reported that the W1SYE repeater was operational with a standby unit at slightly more than standard power, that the main unit had been repaired, and would be reinstalled as weather permits.

Winter Field Day was described and operators solicited by leads Jay Nuzum, and Jim Sendrak. Willy Maclean added details to the operating environment.

Mike Cullen described the GMRS/FRS drill involving all three island towns plus North Kingstown. Mike Rousseau and John Jackman were also involved.

President Jim Sammons, Mike Cullen, and Youth Coordinator for RI Rowan Egbert described the upcoming School Club Roundup to be run by NCRC volunteers at All Saints Steam Academy beginning February 10th.

President Jim Sammons presented a photo review of NCRC Island and other activations and described future activations that club members will be welcome to participate in.

The meeting closed with an appeal to members to voice their desires for programs and activities that they would like to see in the future, including scheduling of future licensing classes.

Adjournment at 20:23

Old Business

New Business

- Contracting of a Cube Smart 5x5 storage space in North Kingstown
- Approval of three-month contract cost of storage space, \$54.00
- Approval of expenses associated with Winter Field Day.
- From the floor?

A photograph of two people sitting in blue folding chairs inside a tent. They are wearing winter gear, including hats and jackets. The person on the right has a backpack with the Olympic rings logo. In the background, a sign with the word 'TERRA' is visible. The scene is dimly lit, suggesting an indoor or shaded environment. The text 'Winter Field Day January 25th and 26th 2025' is overlaid in red on the image.

And now for something
completely different

*Tides, shifting seasons,
Melankovitch Cycles, and Ham
Radio as Complex Wave Forms*

Complex waves

Simple sine waves of decreasing frequency

Sum of simple sine waves

Forming a complex wave

Here a concert D tone is added to a second tone of concert A.

The result is the sound pressure wave that reaches your ear.

Include in sum

Include in sum

Include in sum

Include in sum

Sum of Waveforms:

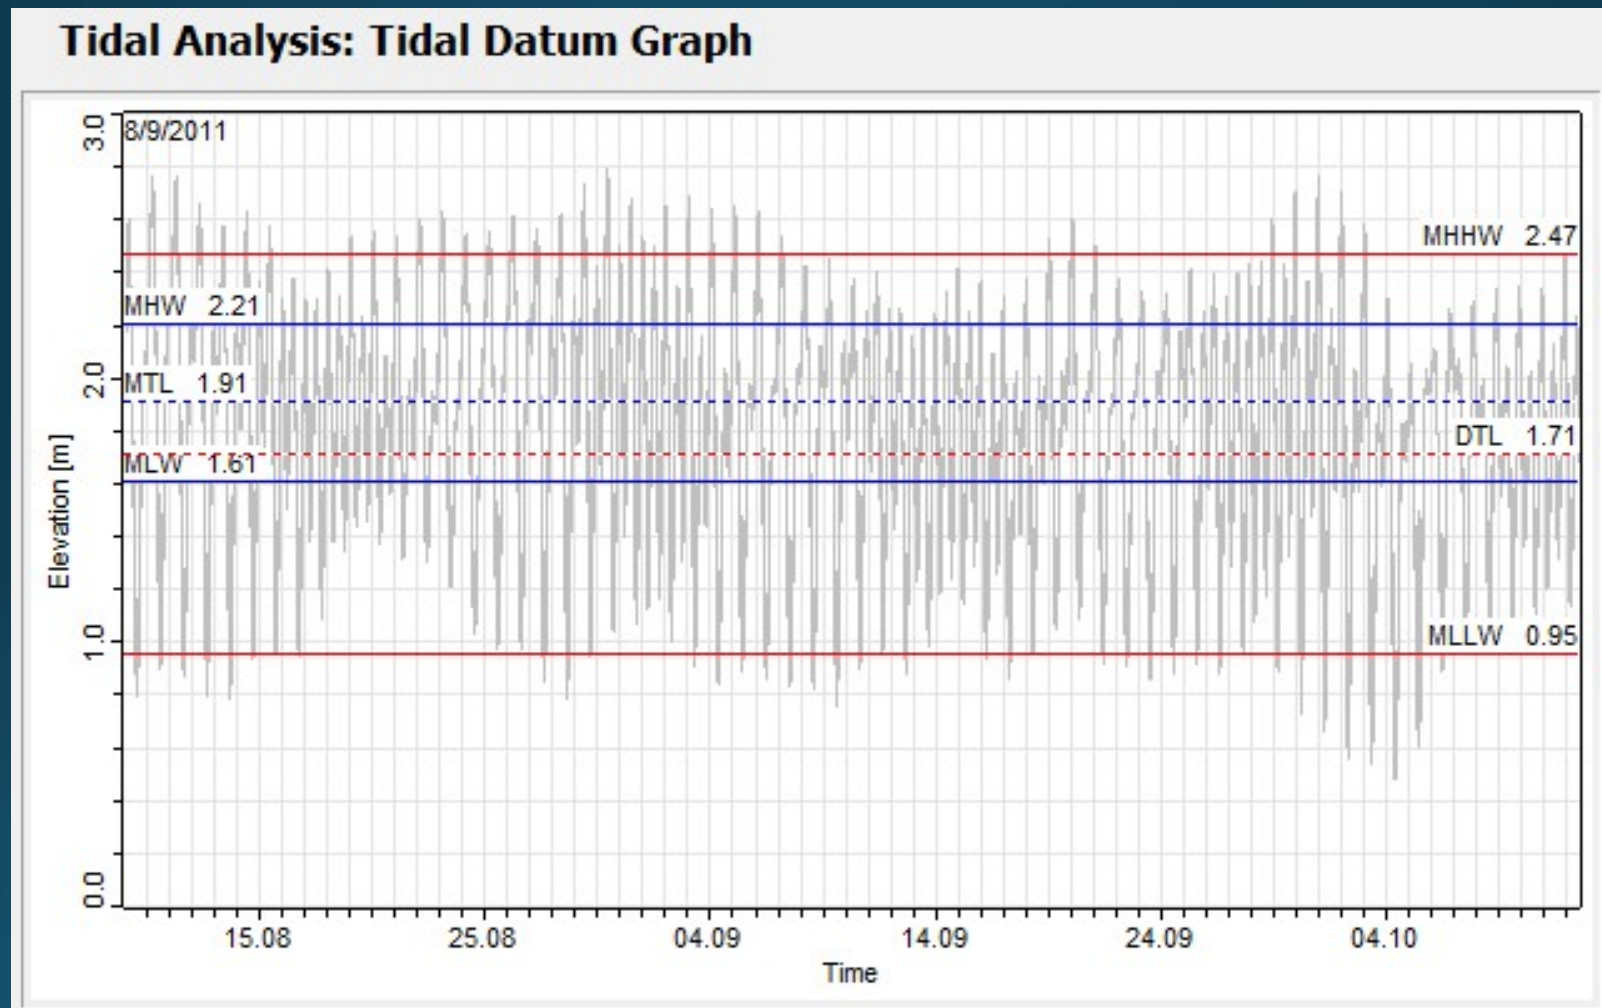

Tidal data are an excellent example of a complex wave.

The cone is an ultra sonic projector that measures the distance to the sea surface every few minutes.

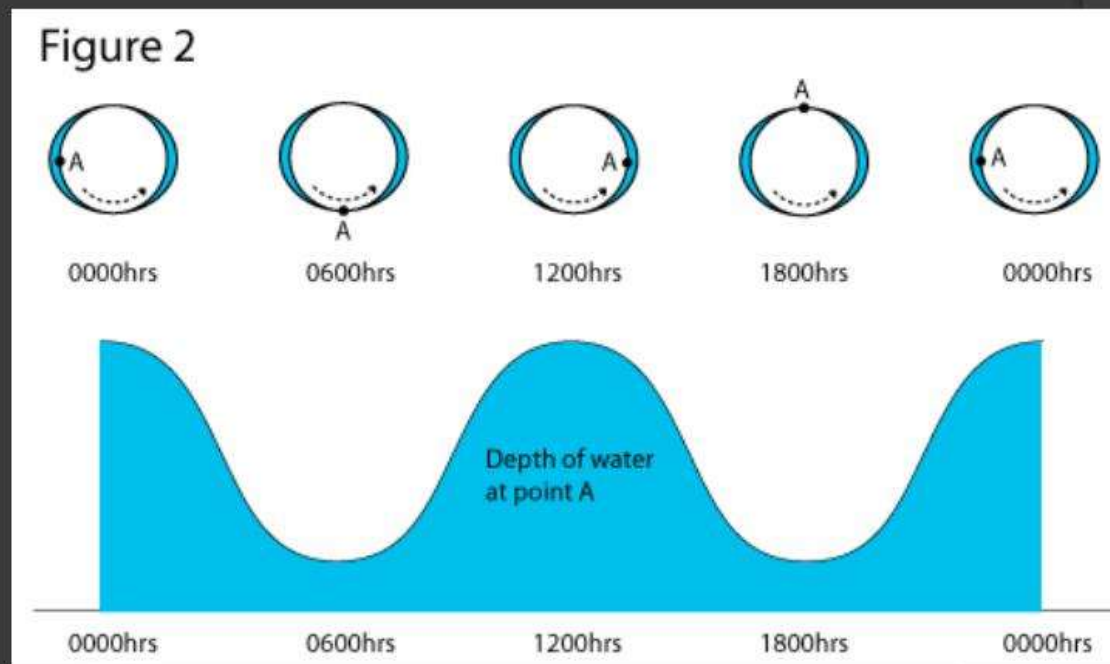

Somewhat smoothed raw sea surface height readings

To make a Tide Table, the complex wave first must be converted to its component sine waves. This is the job of the Fast Fourier Transform – FFT. The raw time domain data are “transformed” into frequency domain data.

Idealized tide prediction

- Two high tides/two low tides per lunar day
- Six lunar hours between high and low tides

The fabulous Fourier Transform

The FFT changes a time domain graph into a frequency domain bar graph.

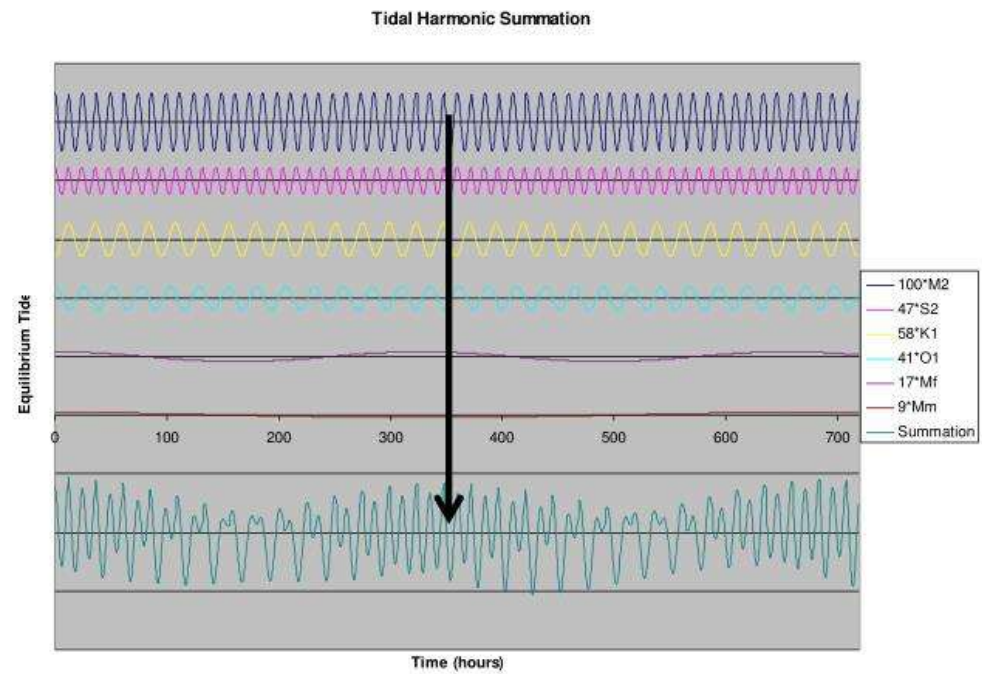

The result is an array of the sine wave components that formed the original complex wave.

Tide Predictions

USC&GS Tide Predicting Machine

[StockFreeImages.com](https://www.stockfreemages.com)

ID: 87380255

Here is an adjustable cam that will allow one engine to make predictions for multiple harbors.

But why so many cams?

Are there really that many
sine wave components in a
tide cycle?

Now for a little Astronomy

As you know, the Moon is the main cause of the tides.

The Sun also causes tides, but although much bigger, it's further away and has less effect.

The difference in Earth-Moon gravity at each location generates two tidal bulges.

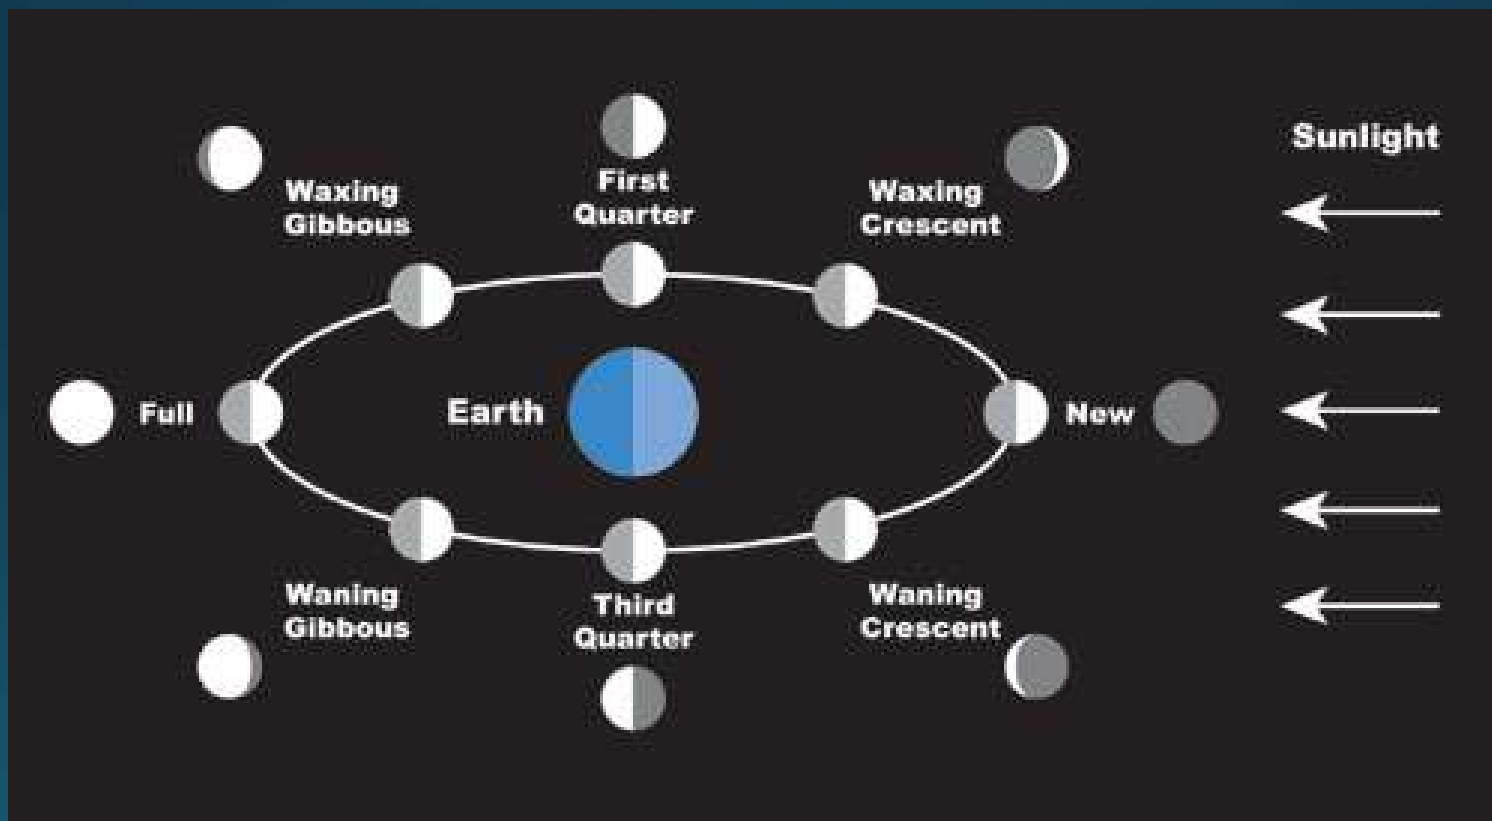

Sun

It takes about 28 days from one
New Moon to the next

The Moon as seen from Earth

Because a Lunar Month is about 28 days long, each lunar quarter is about a week apart.

The Lunar Cycle
accounts for the first
cam, but that's just
the first sine wave.

Sampled and further smoothed sea surface heights

Fourier Transform reveals that the centers of the first two swells are fourteen days apart. That's half a Lunar Cycle.

Sun and Moon in alignment

Sun and Moon in misalignment

Neap Tides and Spring Tides

Here is another example of FFT revealing the astronomy behind an observed phenomenon.

The period of spring-neap tides corresponds to the time between Sun-Moon alignment-misalignment.

Add a second cam

Semi-diurnal Inequality

This tidal element often goes unnoticed:

Alternating high tides are of different heights. Their following low tides are of different depths.

You've seen the result of this inequality, but probably didn't recognize it.

Paired wrack lines

What causes alternating high tides to swing between higher high then lower high levels?

The Fourier Transform shows us that the period of this alternation is twice the tidal cycle. In other words, about 25 hours or a lunar day.

Earth's Orbit

Try your hand – winter or summer in the Northern Hemisphere?

Earth's Orbit

Semi-Diurnal Inequality builds and fades as the Moon moves between spring and neap tides. This strong-weak rhythm also moves as Earth moves between seasons.

Add a third and fourth cam.

Those are the biggies of tidal predicting, but there are many more.

It's important to note that for casual use, those three components will do, but to make a tide table that goes out several years, the other sine waves must be resolved and included.

The Moon's orbit is slightly oblate and the long axis migrates with a period of 8.85 years.

Further, the amount that it varies from circular also cycles from nearly round to more oblate.

The plane of the Moon's orbit is slightly different than the plane of Earth's orbit. This effects the tides and the occurrence of solar and lunar eclipses.

In summary, there are eleven important cycles that determine the tides. But as you saw from the cams of the tide predicting engines, there can be as many as thirty-seven!

Before we leave tides, here is something that you can impress your grandkids with.

Eldridge was found in every commercial vessel's wheel house.

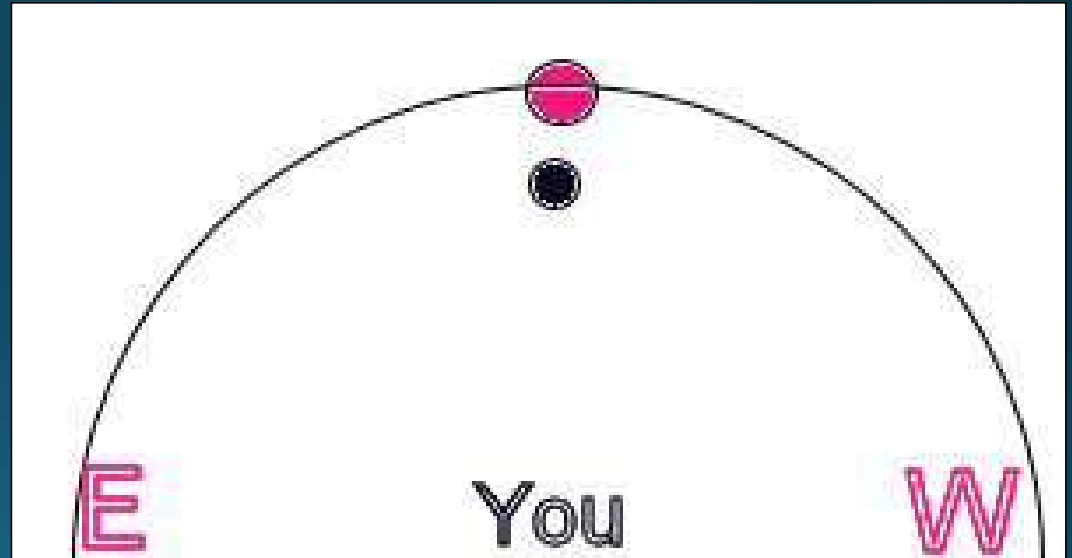

But before tide tables, every captain needed a way to approximate the time of high water.

Tidal bulges, time of day, and Moon phases.

In a frictionless all-water world, the centers of both tidal bulges would lie in line with the Moon.

New Moon at Noon and high tide.

Tidal bulges and the effect of geography

But in our world, the tidal bulges are slowed. The amount of delay for each harbor is called the *Establishment of the Port*.

The Establishment of the Port for Newport is 6 hours.

Moon movement and time of high tide.

A day later, the Moon has moved counterclockwise.

High tide will occur about an hour later, or at 13:00

Still assuming a frictionless world

Looking South at Noon. The New and Full Moons are under and opposite the Sun.

Looking South at Noon. The First and Third Quarter Moons are on the horizon.

Quick rule of thumb for Newport Harbor:

- New and Full Moon – High Tide at 6:00 AM and PM.
- First and Third Quarter -High Tide at Noon and Midnight.

Where is the Moon today?

Waxing Gibbous
on the 9th.

Full Moon on the
12th.

Part way between
today.

The Moon will be directly above us two hours before Midnight – 22:00.

Add the Establishment of the Port, six hours, and high water will occur around 04:00 in the morning.

The Moon will be directly under us two hours before Noon tomorrow – 10:00

Add the Establishment of the Port, six hours, and high water will occur around 16:00 that afternoon.

Your turn: At what time will high tide occur?

A day later, the Moon has moved counterclockwise.

1. Guestimate the time when the Moon will be overhead.

2. Now add the Establishment of the Port – 6 hours.

Real world with friction

Predicting the tides is hard enough. Predicting currents is just plain squirrely

Katama Bay and Poge Pond from the air.

Martha's Vineyard

Edgartown
Harbor
entrance

Norton
Point

The Gut –
entrance to
Poge Pond.

Poge Pond
tide is 90
degrees out
of phase.

In our look at tides, we've been concerned with the direction and strength of the Sun and Moon's gravity.

In our next complex wave example, we will be concerned only with the strength of the Sun's radiation.

Milankovitch Cycles

- Changes in Earth's orbit from nearly circular to more elliptical. The distance to the sun varies more during a more elongated orbit period
- Changes in the direction of the long axis of Earth's elliptical orbit.
- Changes in the degree of obliquity (tilt) of Earth.
A more oblique Earth has more extreme seasons.
- Changes in direction of Earth's tilt (axial precession).
Changes in the direction of Earth's tilt change the time of year of our seasons.

Milankovitch Cycles

Eccentricity

Obliquity

Precession

Precession of
Earth's orbit.

We saw this
earlier with the
Moon, but
Earth does the
same thing.

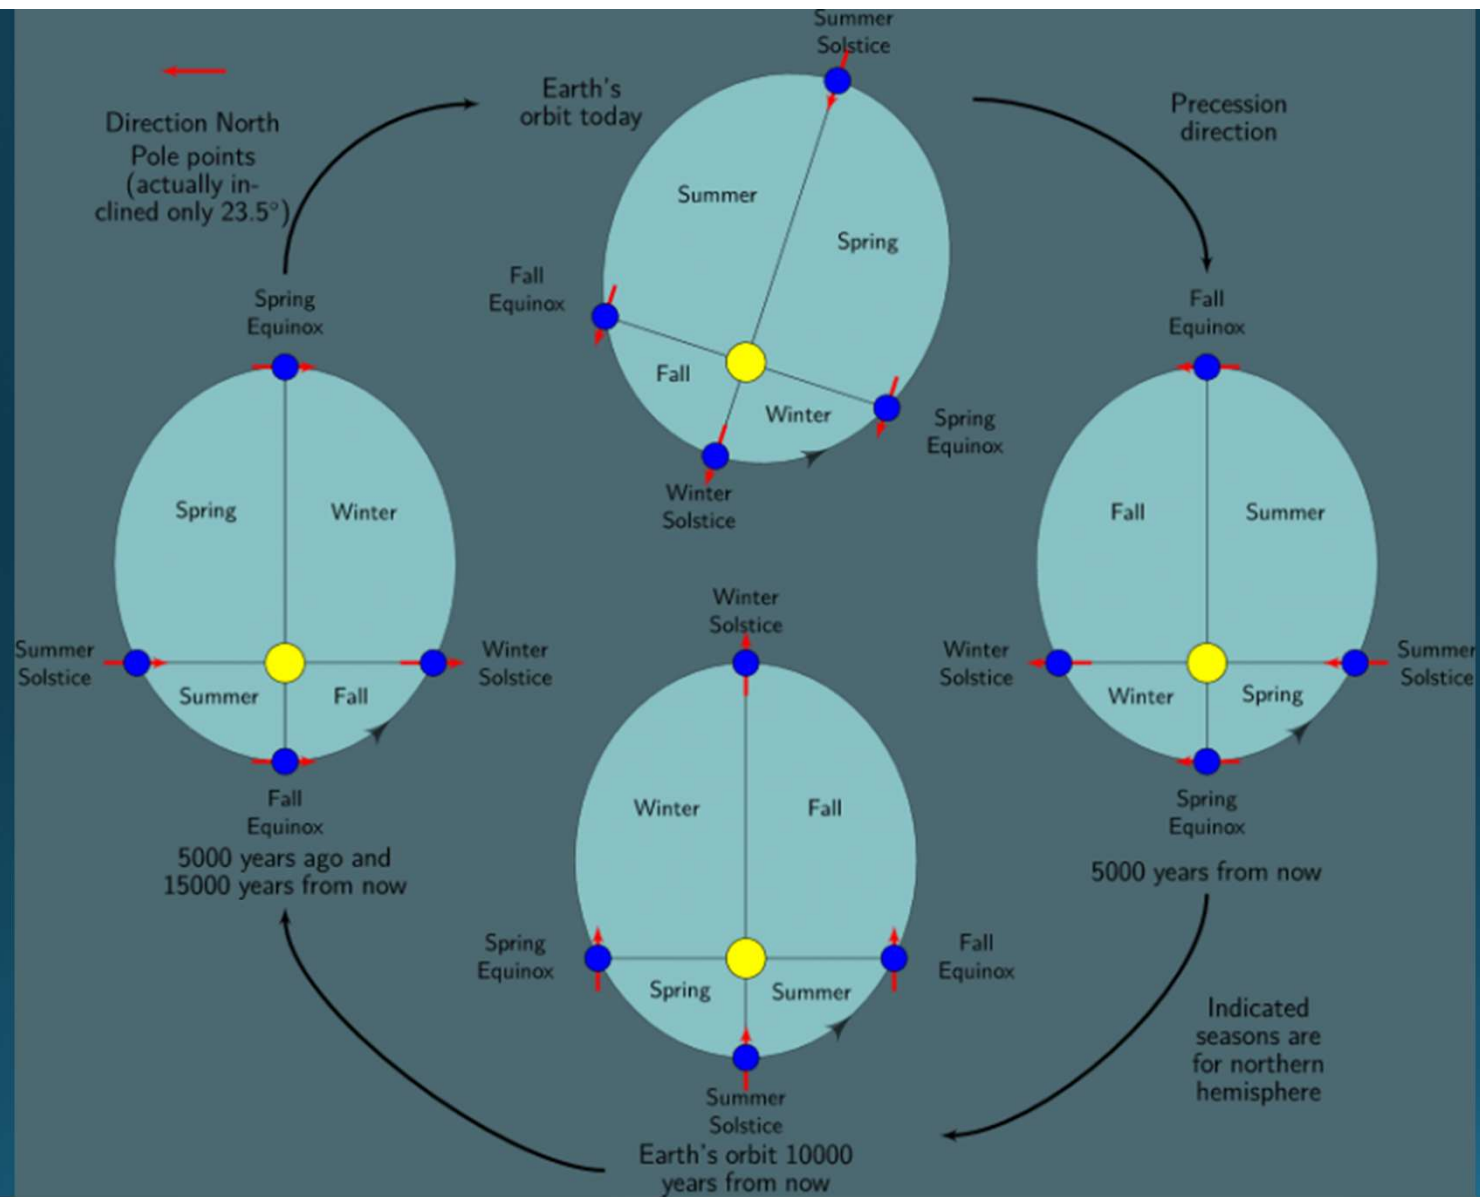

The shape of Earth's orbit changes systematically

Like a spinning top, Earth's axis rotates in space

Fourier analysis has been around for a long time. Joseph Fourier started the idea in the early 1800s, but others have refined it since.

Some of the central concepts go back as far as the Babylonians.

Temperature and CO₂ Over Time
